Job Market Paper

"IPO Spillovers: Evidence from Private-Firm Networks" *Job Market Paper*

I study how initial public offering (IPO) decisions propagate through firm networks formed by common investors. Using a dynamic network constructed from investment data covering 2000–2023, I show that firms are more likely to go public after directly connected peers complete IPOs. A 10-percentage-point increase in peer IPO exposure is associated with an increase in IPO probability equivalent to 65% of the average annual IPO probability. These spillovers are stronger when firms are connected through lead investors, but weaker when their peers have already been exposed to IPO activity through more distant network connections. Firms with prior peer IPO exposure also go public at higher valuations and share prices, attract new investors and receive more private funding. To rationalize the findings, I develop a dynamic learning model in which peer IPOs reveal information to connected private firms about how the public market values their common investors. This learning raises the price that firms expect to obtain from going public and explains the main empirical patterns.
